INTRO ALGORITHMS

# A NEW REALITY

**A DAY IN DATA**

The exponential growth of data is undraped, but the numbers behind this explosion - fuelled by internet of things and the use of connected devices - are hard to comprehend, particularly when looked at in the context of one day.

Category	Value
Tweets sent	500m
Emails sent	294bn
People on Earth	7.8bn
Photos taken	3.9bn
Facebook posts	4TB
WhatsApp messages	65bn
Facebook posts	463EB
Instagram posts	95m
Smartphone users	2.8bn
Searches made	5 billion
Connected car	4TB
YouTube video views	3.5bn
Facebook posts	4.4ZB
YouTube video views	4.4ZB

Each day (2019):  
 500 million tweets are sent  
 294 billion emails are sent (306bn by 2020; 320bn by 2021)  
 4 petabytes of data created by Facebook  
 4 terabytes of data produced by a connected car  
 65 billion messages sent over WhatsApp  
 5 billion searches made a day

(Raconteur, <https://www.raconteur.net/infographics/a-day-in-data>)

Today's society is based on the information and knowledge extracted (also) from the available data.  
 Never as of today so many data have been produced - around 1,7 MB per person each second, representing over 2,5 exabytes ( $2,5 \times 10^{18}$  bytes) per day.  
 The accumulated digital universe of data is of 44 zettabytes ( $44 \times 10^{21}$  bytes) in 2020, and a total of 463 exabytes of data is estimated to be produced every day by 2025.

Algorithms (& Data Structures)

INTRO ALGORITHMS

# how much data is produced every day?

**DATA**

**2.5 Exabytes** ( $10^{18}$  bytes = 1 million terabytes)

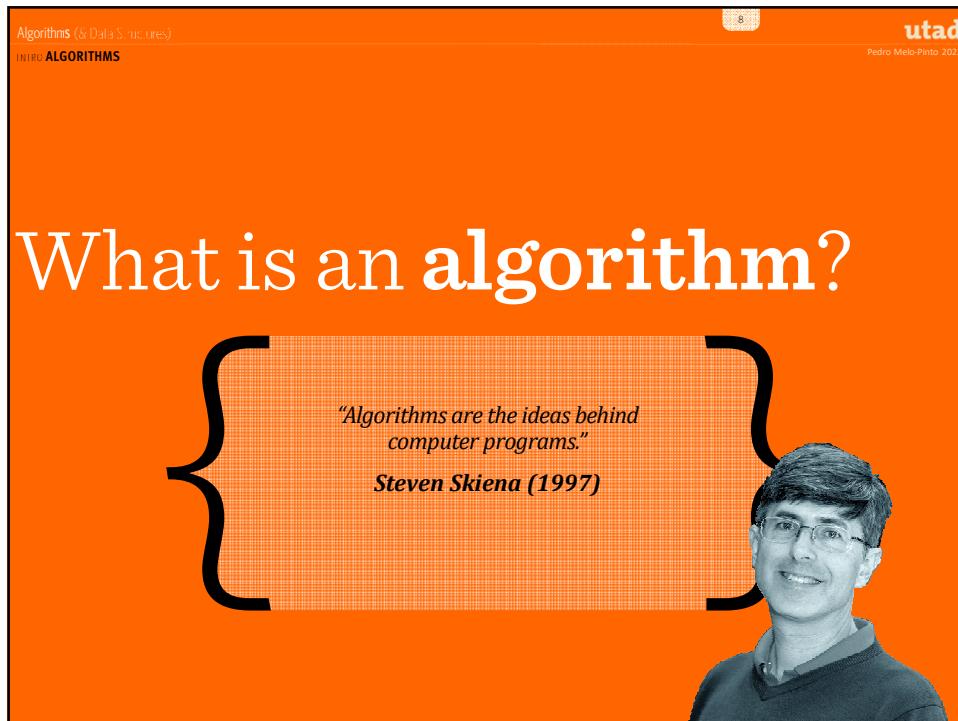

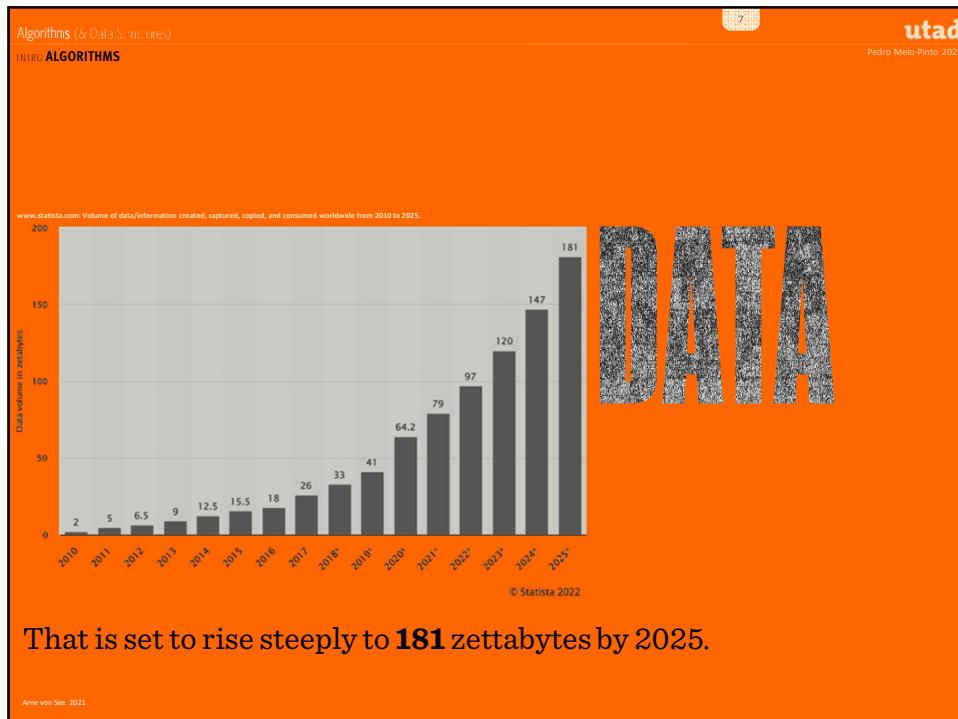

or

5 million laptops

250 000 Libraries of Congress

90 yrs of HD video

# What is an algorithm?

An algorithm is a recipe, method, or technique for doing something.  
Made up of a finite set of rules or operations that are unambiguous and simple to follow.

Wilson R.A. and Keil F.C. eds., 1999  
The MIT Encyclopedia of the Cognitive Sciences

Algorithms (& Data Structures)  
INTRO ALGORITHMS

10 utad  
Pedro Melo-Pinto 2022

# What is a algorithm?

A well-defined computational procedure that takes some value, or set of values, as *input* and produces some value, or set of values, as *output*.

computer

```
graph LR; Input((input)) --> Algorithm[algorithm]; Algorithm --> Output((output))
```

A sequence of computational steps that transform the *input* into the *output*.

Cormen T.H., Leiserson C.E., Rivest R.L. and Stein C., 2009  
Introduction to Algorithms.

Algorithms (& Data Structures)

11

utad  
Pedro Melo-Pinto 2022

computer

# What is a algorithm?

A **well-defined computational procedure** that takes some value, or set of values, as **input** and produces some value, or set of values, as **output**.

A tool for solving a well-specified **computational problem**.

problem **specification** includes what the input is, what the desired output should be; the algorithm describes a specific computational procedure for achieving the desired output for a given input.

algorithm specification may be in English, as a computer program, even as a hardware design.

Cormen T.H., Leiserson C.E., Rivest R.L., and Stein C., 2009

# Which are the most important **algorithms**?

For (computer) scientists

1. A\* search algorithm
2. Beam Search
3. Binary search
4. Branch and bound
5. Buchberger's algorithm
6. Data compression
7. Diffie-Hellman key exchange
8. Dijkstra's algorithm
9. Discrete differentiation
10. Dynamic programming
11. Euclidean (greatest common divisor) algorithm
12. Expectation-maximization algorithm (EM-Training)
13. Fast Fourier transform (FFT)
14. Gradient descent
15. Hashing
16. Heaps (heap sort)
17. Karatsuba multiplication
18. Lenstra-Lenstra-Lovasz lattice reduction algorithm
19. Maximum flow
20. Merge sort

Algorithms (& Data Structures)

INTRO ALGORITHMS

utad  
Pedro Melo-Pinto 2022

## Which are the most important **algorithms**?

**For job (coding) interviews**

- to implement:**
  - Binary Search (with or without recursion)
  - Linear search
  - Bubble Sort
  - Insertion Sort
  - Quicksort (iterative or not)
  - MergeSort
  - Counting sort
  - Radix sort
  - Level Order Search in a Binary Tree
  - Swap two numbers without using the third variable
  - Check if Two String are Anagram
  - Sieve of Eratosthenes for Prime Number
- to know:**
  - Difference between stable and unstable sorting
  - Difference between Comparison and Non-Comparison
  - Sorting Depth First Search for a binary tree

Algorithms (& Data Structures)

INTRO ALGORITHMS

utad  
Pedro Melo-Pinto 2022

## example

Add the first  $n$  integers:

**Input:** A set of  $n$  integers  $\{a_1, a_2, \dots, a_n\}$ .

**Output:** Start with sum=0. Add iteratively the value of each integer to the sum until there are no more elements.

An instance of the addition problem:	(input) A set of 6 integers $\{1, 2, 3, 4, 5, 6\}$ $n = 6$ .
Expected output for given instance:	(output) 21.

Algorithms (& Data Structures)  
INTRO ALGORITHMS

example ①

Add the first  $n$  integers:

Or add the numbers in pairs, observing that

1	+	100	=	101
2	+	99	=	101
3	+	98	=	101
...				
48	+	53	=	101
49	+	52	=	101
50	+	51	=	101

The total is  $50 * 101$ , which is 5050.

When we are looking for the sum of a sequence, we call it a series.  
There is a special formula we can use to find the sum of a series:  $S = \frac{n(n + 1)}{2}$

16 Pedro Melo-Pinto 2022

utad

Algorithms (& Data Structures)  
INTRO ALGORITHMS

example ②

Multiplying Integers :

**Input:** A set of  $n$  integers  $\{a_1, a_2, \dots, a_n\}$ .

**Output:** Adding as many copies of one of them, as the value of the other

**one.** Don't forget that  $a_1 \times a_2 \times a_3 \Leftrightarrow (a_1 \times a_2) \times a_3$

<b>An instance of the multiplying problem:</b> Expected output for given instance:	(input) A set of 4 integers {3, 10, 4, 2} or [(3×10)×4]×2. (output) 240.
---	---

Rule 1: The product of a positive integer and a negative integer is a negative integer.  
Rule 2: The product of two negative integers or two positive integers is a positive integer.

Introduction to Algorithms.

Algorithms (& Data Structures)

26

utad  
Pedro Melo-Pinto 2022

example 3

sorting is a fundamental operation in computer science  
(many programs use it as an intermediate step)

we have a large number of good sorting algorithms at our disposal

the best algorithm for a given application depends on
the number of items to be sorted
the extent to which the items are already somewhat sorted
possible restrictions on the item values
the architecture of the computer
the kind of storage devices to be used
and others.

# Algorithm correctness

An algorithm is said to be **correct** if, for every input instance, it halts with the correct output.

Wilson R.A. and Keil F.C. eds. 1999  
The MIT Encyclopedia of the Cognitive Sciences

Algorithms (& Data Structures)  
ALGORITHMS ANALYSIS & COMPLEXITY

## The sorting problem

**Input:** A sequence of  $n$  numbers  $(a_1, a_2, \dots, a_n)$ .

**Output:** A permutation  $a'_1, a'_2, \dots, a'_n$  of the input sequence such that  $a'_1 \leq a'_2 \leq \dots \leq a'_n$ .

Illustration of the selection problem      Output: A sequence of numbers  $(1, 4, 2, 3, 5, 7, 6)$   
Familiar input: Integer factorization      Output: The prime factorization of  $108 = 2^2 \cdot 3^3 \cdot 5^0$

we have a large number of good sorting algorithms at our disposal

# HOW TO CHOOSE ONE?

The choice of the best algorithm for a particular task can be a complicated process, perhaps involving sophisticated mathematical analysis. The branch of computer science that comprises the study of such questions is called *analysis of algorithms*.

## How to analyse an algorithm?

- A** Develop a good implementation.
- B** Identify unknown quantities ( $q$ ) representing the basic operations.
- C** Determine the cost of each basic operation.
- D** Develop a realistic model for the input.
- E** Analyse the frequency of execution of the unknown quantities.
- F** Calculate the total running time:  $\sum_q \text{frequency}(q) \times \text{cost}(q)$

Donald Knuth (1960s)

A generic one-processor, **random-access machine (RAM)** model of computation

# How to analyse an algorithm?

Our algorithms will be implemented as computer programs  
In the RAM model, instructions are executed one after another, with no concurrent operations

Our guide is how real computers are designed  
The RAM model contains instructions commonly found in real computers:  
arithmetic (such as add, subtract, multiply, divide, remainder, floor, ceiling), data movement (load, store, copy), and control (conditional and unconditional branch, subroutine call and return)  
Each such instruction takes a constant amount of time

62

**BACK TO**

example 3 THE SORTING PROBLEM insertion sort efficient algorithm for sorting a small number of elements

# does it work?

**claim:** InsertionSort “works”

**Proof by Induction**

Let A be a list of length n

Inductive Hypothesis:  
A[i+1 elements] is sorted at the end of the  $i^{\text{th}}$  iteration.

Base case ( $i=0$ ):  
A[1 element] is sorted at the end of the 0'th iteration.

Inductive step:  
For any  $0 < k < n$ , if the inductive hypothesis holds for  $i=k-1$ , then it holds for  $i=k$ .  
Aka, if A[k elements] is sorted at step  $k-1$ , then A[k+1 elements] is sorted at step  $k$

Conclusion:  
The inductive hypothesis holds for  $i = 0, 1, \dots, n-1$ .  
In particular, it holds for  $i=n-1$ .  
At the end of the  $n-1^{\text{st}}$  iteration (the end of the algorithm), A[n elements] is sorted.

**BACK TO**

**example** ③ **THE SORTING PROBLEM**

**insertion sort**

**Theory of Algorithms**  
concentrates on determining the growth of the worst-case performance of the algorithm (an "upper bound")

**PROGRAM**

```
void InsertionSort(int v[N], int n)
{
    int i,j,aux;
    for(i=2;i<=n;i++)
    {
        aux = v[i-1];
        j = i-1;
        while(j>0 && v[j-1]>aux)
        {
            v[j] = v[j-1];
            j = j - 1;
        }
        v[j] = aux;
    }
}
```

Let's start with Knuth's approach

Algorithms (& Data Structures)  
ALGORITHMS | ANALYSIS & COMPLEXITY | METHODOLOGIES

utad  
Pedro Melo-Pinto 2022

**BACK TO**

**example** ③ **THE SORTING PROBLEM**

**insertion sort**

**Theory of Algorithms**  
concentrates on determining the growth of the worst-case performance of the algorithm (an "upper bound")

**PROGRAM**

```
void InsertionSort(int v[N], int n)
{
    int i,j,aux;
    for(i=2;i<=n;i++)
    {
        aux = v[i-1];
        j = i-1;
        while(j>0 && v[j-1]>aux)
        {
            v[j] = v[j-1];
            j = j - 1;
        }
        v[j] = aux;
    }
}
```

- ➊ the running time of the algorithm is the sum of running times for each statement executed
- ➋ each statement  $i$  is executed in a constant time  $c_i$
- ➌ a statement that takes  $c_i$  to execute and executes  $n$  times will contribute  $c_i \times n$  to the total running time

 $t_i = i$

running time:  

$$T(n) = \left(\frac{c_4}{2} + \frac{c_5}{2} + \frac{c_6}{2}\right)n^2 + (c_1 + c_2 + c_3 + \frac{c_4}{2} - \frac{c_5}{2} - \frac{c_6}{2} + c_7)n - (c_2 + c_3 + c_4 + c_7)$$

Algorithms (& Data Structures)  
ALGORITHMS | ANALYSIS & COMPLEXITY | METHODOLOGIES

utad  
Pedro Melo-Pinto 2022

Most of the times, we do worst case analysis to analyse algorithms. In the worst case analysis, we guarantee an upper bound on the running time of an algorithm.

The average case analysis is not easy to do in most of the practical cases since we must know or predict the mathematical distribution of all possible inputs.

The best case analysis is bogus. Guaranteeing a lower bound for an optimal case still allow for an algorithm to take years to run with a different input.

Algorithms (& Data Structures)  
ALGORITHMS ANALYSIS & COMPLEXITY | ASYMPTOTIC NOTATION

utad  
Pedro Melo-Pinto 2022

## Mathematical notations **Big-Oh** asymptotic upper bound

**Definition** Given a function  $g(n)$ ,

$\mathbf{O}(g(n))$  denotes the set of all  $f(n)$  such that  $\left|\frac{f(N)}{g(N)}\right|$  is bounded from above as  $n \rightarrow \infty$ .  
(asymptotically bounds a function from above)

$\mathbf{O}(g(n)) = \{f(n) : \exists c > 0, n_0 > 0 \text{ such that } \forall n \geq n_0; f(n) \leq c g(n)\}$

**O-notation** provides a way to express an upper bound.

$f(n) = \mathbf{O}(g(n))$

ALGORITHMS ANALYSIS & COMPLEXITY | ASYMPTOTIC NOTATION

utad  
Pedro Melo-Pinto 2022

## Mathematical notations **Big-Omega** asymptotic lower bound

**Definition** Given a function  $g(n)$ ,

$\mathbf{\Omega}(g(n))$  denotes the set of all  $f(n)$  such that  $\left|\frac{f(N)}{g(N)}\right|$  is bounded from below by a (strictly) positive number as  $n \rightarrow \infty$ .

$\mathbf{\Omega}(g(n)) = \{f(n) : \exists c > 0, n_0 > 0 \text{ such that } \forall n \geq n_0; f(n) \geq c g(n)\}$

**\Omega-notation** provides a way to express a lower bound.

$f(n) = \mathbf{\Omega}(g(n))$

Sedgewick R., Flajolet P., 2013  
An introduction to the Analysis of Algorithms.

Cormen T.H., Leiserson C.E., Rivest R.L. and Stein C., 2009  
Introduction to Algorithms.

Algorithms (& Data Structures)  
ALGORITHMS ANALYSIS & COMPLEXITY | ASYMPTOTIC NOTATION

75  
utad  
Pedro Melo-Pinto 2022

## Mathematical notations **Big-Theta** asymptotically tight bound

**Definition** Given a function  $g(n)$ ,

$\Theta(g(n))$  denotes the set of all  $f(n)$  such that  $\frac{f(N)}{g(N)}$  is bounded from both above and below as  $n \rightarrow \infty$ .

$\Theta(g(n)) = \{f(n) : \exists c_1, c_2 > 0, n_0 > 0 \text{ such that } \forall n \geq n_0: c_1 g(n) \leq f(n) \leq c_2 g(n)\}$

$\Theta$ -notation provides a way to express matching upper and lower bounds.

Algorithms (& Data Structures)  
ALGORITHMS ANALYSIS & COMPLEXITY | ASYMPTOTIC NOTATION

76  
utad  
Pedro Melo-Pinto 2022

## Mathematical notations **Big-Oh** asymptotic upper bound

Suppose the running time of an algorithm is:

$$T(n) = 10n^2 + 3n + 7 \text{ ms}$$

these constant factors of 10 depends a lot on the computing platform...

these lower-order terms don't really matter as  $n$  gets large.

Algorithms (& Data Structures)  
ALGORITHMS ANALYSIS & COMPLEXITY | ASYMPTOTIC NOTATION

utad  
Pedro Melo-Pinto 2022

## Mathematical notations **Big-Oh** asymptotic upper bound

Suppose the running time of an algorithm is:

$$T(n) = 10n^2 + 3n + 7 \text{ ms}$$

We're just left with the  $n^2$  term!  
That's what's meaningful.

$$T(n) = O(n^2)$$

Algorithms (& Data Structures)  
ALGORITHMS ANALYSIS & COMPLEXITY | ASYMPTOTIC NOTATION

utad  
Pedro Melo-Pinto 2022

BACK TO  
example 1 THE SORTING PROBLEM  
insertion sort

best case:  
running time  $T(n) = (c_1 + c_2 + c_3 + c_4 + c_7)n - (c_2 + c_3 + c_4 + c_7)$   
is **O(n)**

worst case:  
running time  $T(n) = (\frac{c_4}{2} + \frac{c_5}{2} + \frac{c_6}{2})n^2 + (c_1 + c_2 + c_3 + \frac{c_4}{2} - \frac{c_5}{2} - \frac{c_6}{2} + c_7)n - (c_2 + c_3 + c_4 + c_7)$   
is **O(n<sup>2</sup>)**

average case:  
running time  $T(n) = (\frac{c_4}{4} + \frac{c_5}{4} + \frac{c_6}{4})n^2 + (c_1 + c_2 + c_3 + \frac{c_4}{4} - \frac{c_5}{4} - \frac{c_6}{4} + c_7)n - (c_2 + c_3 + \frac{c_4}{2} + c_7)$   
is **O(n<sup>2</sup>)**

example 3 THE SORTING PROBLEM merging sort

# does it work? is it fast?

**claim:** MergeSort runs in time  $O(n \log(n))$

We can analyze it in a different way (using recurrence relations)

example 3 THE SORTING PROBLEM merging sort

# does it work? is it fast?

**01 The Master Theorem**  
Recurrence analysis

Suppose that  $a \geq 1$ ,  $b > 1$ , and  $d$  are constants (independent of  $n$ ).  
Suppose that  $T(n) = aT\left(\frac{n}{b}\right) + O(n^d)$ .  
Then:

$$T(n) = \begin{cases} O(n^d \log(n)) & \text{if } a = b^d \\ O(n^d) & \text{if } a < b^d \\ O(n^{\log_b(a)}) & \text{if } a > b^d \end{cases}$$

Parameters:  
 $a$ : number of sub-problems  
 $b$ : factor by which input size shrinks  
 $d$ : need to do  $n^d$  work to create all the sub-problems and combine their solutions.

example ③ THE SORTING PROBLEM merging sort

## does it work? is it fast?

$T(n) = aT\left(\frac{n}{b}\right) + O(n^d)$

Recurrence analysis

$T(n) = 4T\left(\frac{n}{2}\right) + O(n) = O(n^2)$

$T(n) = 3T\left(\frac{n}{2}\right) + O(n) = O(n^{\log_2(3)} \approx n^{1.6})$

$T(n) = 2T\left(\frac{n}{2}\right) + O(n) = O(n \log(n))$

Master Theorem

$$T(n) = \begin{cases} O(n^d \log(n)) & \text{if } a = b^d \\ O(n^d) & \text{if } a < b^d \\ O(n^{\log_b(a)}) & \text{if } a > b^d \end{cases}$$

recursive integer multiplication

Karatsuba integer multiplication

MergeSort

a = 4      b = 2      d = 1      O( $n^2$ )

a = 3      b = 2      d = 1      O( $n^{1.6}$ )

a = 2      b = 2      d = 1      O( $n \log(n)$ )

example 3 THE SORTING PROBLEM merging sort

## does it work? is it fast?

**02 The Substitution Method**

Recurrence analysis

$$T(n) = 2T\left(\frac{n}{2}\right) + O(n) = O(n \log(n))$$

Step 1: Generate a guess at the correct answer

$$T(n) = 2^t T\left(\frac{n}{2^t}\right) + tn$$

For  $t = \log(n) \rightarrow T(n) = nT(1) + \log(n) n = n(\log(n) + 1)$

example 3 THE SORTING PROBLEM merging sort

## does it work? is it fast?

**02 The Substitution Method**

Recurrence analysis

$$T(n) = 2T\left(\frac{n}{2}\right) + O(n) = O(n \log(n))$$

Step 2: Try to prove that your guess is correct

Inductive Hypothesis:  $T(n) = n(\log(n) + 1)$

Base Case ( $n=1$ ):  $T(1) = 1$

Inductive Step: Assume Inductive Hypothesis for  $1 \leq n < k$ :

Suppose that  $T(n) = n(\log(n) + 1)$  for all  $1 \leq n < k$ .

Prove Inductive Hypothesis for  $n = k$ :

$$T(k) = 2 \cdot T\left(\frac{k}{2}\right) + k = 2 \cdot \left(\frac{k}{2} \left(\log\left(\frac{k}{2}\right) + 1\right)\right) + k = k(\log(k) + 1)$$

So Inductive Hypothesis holds for  $n = k$ .

Conclusion: For all  $n \geq 1$ ,  $T(n) = n(\log(n) + 1) = O(n \log(n))$
